Question 1	Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that A[i] - A[j] = k, i! = j.
Marked out of	Input Format
3.00 P Flag question	mpar of max
Andrea Salaniani	1. First line is number of test cases T. Following T lines contain:
	2. N, followed by N integers of the array
	3. The non-negative integer k
	Output format
	Print 1 if such a pair exists and 0 if it doesn't.
	Example
	Input:
	1
	3135
	4
	Output:
	1
	Input:
	1
	3135
	99
	Output:
	0

Question 2	Sam loves chocolates and starts buying them on the 1st day of the year. Each day of the year, x, is numbered from 1 to Y. On days when x is odd, Sam will buy x chocolates; on days when x is even, Sam will not purchase any
Correct Marked out	chocolates.
5.00 ₹ Flag que	Complete the code in the editor so that for each day Ni (where 1 ≤ x ≤ N ≤ Y) in array arr, the number of chocolates Sam purchased (during days 1 through N) is printed on a new line. This is a function-only challenge, so input is handled for you by the locked stub code in the editor.
	Input Format
	The program takes an array of integers as a parameter.
	The locked code in the editor handles reading the following input from stdin, assembling it into an array of integers (arr), and calling calculate(arr).
	The first line of input contains an integer, T (the number of test cases). Each line i of the T subsequent lines describes the ith test case as an integer, Ni (the number of days).
	Constraints
	1 ≤ T ≤ 2 × 105
	1 ≤ N ≤ 2 × 106
	1 ≤ x ≤ N ≤ Y
	Output Format
	For each test case, Ti in arr, your calculate method should print the total number of chocolates Sam purchased by day Ni on a new line.
	Sample Input 0
	3
	2
	3
	Sample Output 0
	1
	4

```
Question 3
                    The number of goals achieved by two football teams in matches in a league is given in the form of two lists. Consider:
Correct
Marked out of
                        Football team A, has played three matches, and has scored { 1, 2, 3 } goals in each match respectively.
                        Football team B, has played two matches, and has scored { 2, 4 } goals in each match respectively.
F Flag question
                         Your task is to compute, for each match of team B, the total number of matches of team A, where team A has scored less than or equal to the number of goals scored by team B in that match.
                          In the above case:
                         For 2 goals scored by team B in its first match, team A has 2 matches with scores 1 and 2.
                        For 4 goals scored by team B in its second match, team A has 3 matches with scores 1, 2 and 3.
                    Hence, the answer: {2, 3}.
                    Complete the code in the editor below. The program must return an array of m positive integers, one for each maxes[i] representing the total number of elements nums[j] satisfying nums[j] < maxes[j] where 0 < j < n and 0 < i < m, in
                    the given order.
                    It has the following:
                       nums[nums[0],...nums[n-1]]: first array of positive integers
                       maxes[maxes[0],...maxes[n-1]]: second array of positive integers
                    Constraints

    2 ≤ n, m ≤ 105

    1 ≤ nums[j] ≤ 109, where 0 ≤ j < n.</li>

    1 ≤ maxes[i] ≤ 109, where 0 ≤ i < m.</li>

                    Input Format For Custom Testing
                    Input from stdin will be processed as follows and passed to the function.
                    The first line contains an integer n, the number of elements in nums.
                    The next n lines each contain an integer describing nums[j] where 0 \le j < n.
                    The next line contains an integer m, the number of elements in maxes.
                    The next m lines each contain an integer describing maxes[i] where 0 \le i < m.

10
Sample Output 1
Explanation 1
We are given, n = 5, nums = [2, 10, 5, 4, 8], m = 4, and maxes = [3, 1, 7, 8].
1. For maxes[0] = 3, we have 1 element in nums (nums[0] = 2) that is ≤ maxes[0].
2. For maxes[1] = 1, there are 0 elements in nums that are ≤ maxes[1].
3. For maxes[2] = 7, we have 3 elements in nums (nums[0] = 2, nums[2] = 5, and nums[3] = 4) that are ≤ maxes[2].
4. For maxes[3] = 8, we have 4 elements in nums (nums[0] = 2, nums[2] = 5, nums[3] = 4, and nums[4] = 8) that are ≤ maxes[3].
Thus, the function returns the array [1, 0, 3, 4] as the answer.
